CRYPTO & COFFEE

The market traded mixed, with market participants seemingly unable to decide whether to focus on the bearish technical price indicator, or the recent drop in the mining difficulty which may act as a catalyst for another surge higher in the hashrate.

Technically, Bitcoin has formed a so-called Death Cross pattern (when the shorter-term moving average, such as the 50 DMA, crosses down the longer-term moving average, which is the 200 DMA), which tends to be a bearish indicator.

At the same time, Bitcoin mining difficulty has decreased by a massive 15.95%. The decrease was the second largest in the history of the cryptocurrency and the largest downward adjustment took place in 2011, when the mining difficulty fell 18.03%. In short, this means that miners that were priced out, now have an extra breathing room before the block reward halving, with Bitcoin Cash (BCH) due to undergo block reward halving first in early April, followed by BitcoinSV (BSV) and then Bitcoin (BTC) in mid-May.

Finally, in a new letter to investors, CEO of blockchain and crypto hedge fund Pantera Capital says he believes Bitcoin (BTC) will likely shatter its all-time high of \$20,000 in the next 12 months.
